

Pushing the Energy Efficiency Envelope through Appliance Standards Around the World

Christine Egan
Executive Director, CLASP

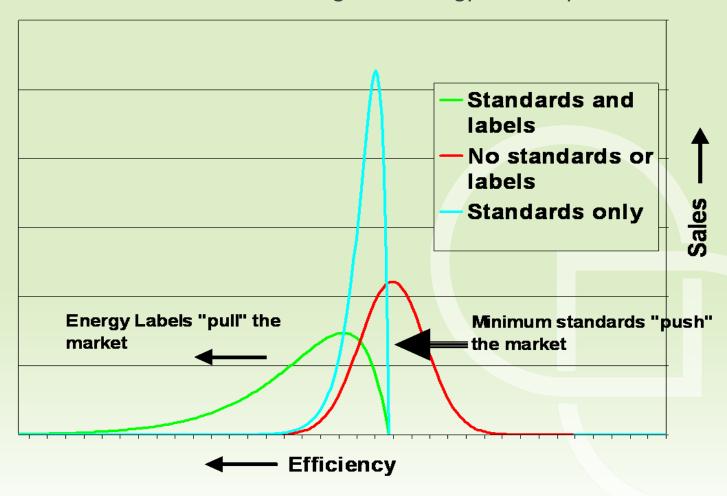

Over 75 countries with more than 80 percent of the world's population have energy standards & labeling

Market Transformation

Standards and labels work together to push and pull the market toward greater energy efficiency.

Standards and Labeling Programs Impact the Environment

Reducing the energy consumption of a product

On aggregate, reduces overall energy consumption

Which, reduces power demand

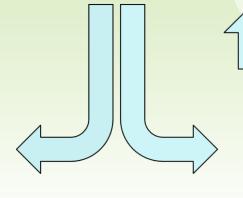

Which, reduces the need for the production of electricity

Therefore, reducing green house gas emissions and other pollutants

And, increasing the feasibility of renewable

Reasons for Implementing Standards and Labeling Programs

Countries adopt standards and labeling policies for a number of reasons

- Reduce capital investment in the energy supply infrastructure
 - a) Less expensive than energy production
 - b) Makes renewable energy more affordable by reducing the need for energy production
- 2. Avert urban/regional pollution
- 3. Promote competitiveness of domestic manufacturers by avoiding non-tariff trade barriers
- 4. Secure energy independence
- 5. Meet climate change goals

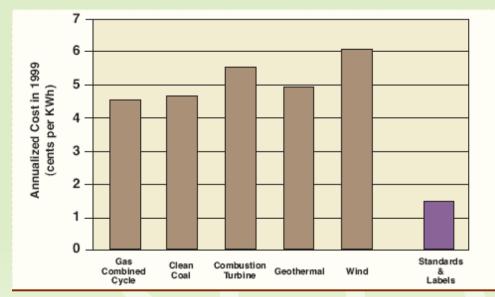

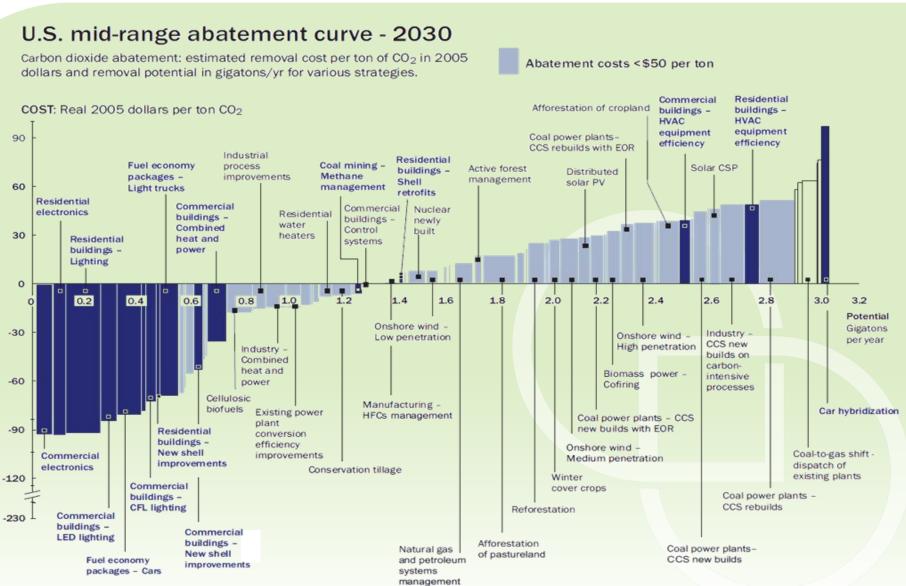

Figure 2-2 The cost of electricity in the U.S. from various new sources Source: U.S. Energy Information Administration's National Energy Modeling System and (Meyers 2004)

Buildings Technology Efficiency is Most Cost Effective

Energy Efficiency Standards

Energy efficiency standards "PUSH" the market towards greater energy efficiency by removing inefficient products from the market.

 Prescriptive Standards require that a particular feature or device be installed in all new products.

Minimum Energy Performance Standards (MEPS)
 require that a manufacturer achieve in each and every
 product a minimum efficiency (or maximum energy
 consumption); but does not require a specific
 technology or design.

 Class-average Standards specifies the average efficiency of a manufactured product, allowing each manufacturer to select the level of efficiency for each model so that the overall average is achieved.

Energy Efficiency Standards(Minimum Energy Performance Standards)

 The government sets a limit on the total amount of energy a product can use annually

≤ 400 kWh/a

- 2. The manufacturer designs the product to use less energy then the limit
- 3. The manufacturer tests the product using a designated test procedure to certify it uses less energy than the limit
- 4. The manufacturer then submits these results to the government or self-certifies them

Energy Efficiency Standards Shift Markets

Clothes Washer Energy Factors in the U.S. before and after the 1994 standard

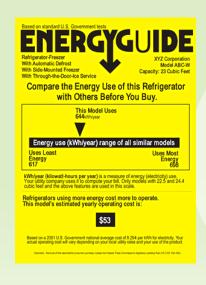

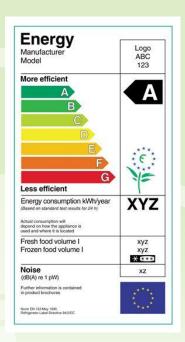

Comparative Label

Comparative energy efficiency labeling "PULLS" the market towards greater energy efficiency by allowing consumers to compare the energy efficiency of products while making a purchasing decision, thus motivating manufactures to build products that that are more efficient then their competitors.

Categorical Label (Dial)

Continuous Label

Categorical Label (Bars)

Comparative Labels (Categorical)

1. The government sets discreet categories based on specific ranges of energy use allowing comparison between products

| Category | Energy Range | | | | | |
|----------|-----------------|--|--|--|--|--|
| Α | <400 kWh/a | | | | | |
| В | 400 - 499 kWh/a | | | | | |

- 2. The manufacture builds the product and test its energy use using a designated testing procedure in order to determine the proper category
- 3. The manufacture submits the results to the government or self certifies
- 4. The manufacturer labels their product with the correct category

Endorsement Label

Endorsement energy efficiency labeling "PULLS" the market toward greater energy efficiency by identifying for consumers the most energy efficient products, thus providing an incentive (market advantage) for manufacturers to build highly efficient product.

United States

European Union

Korea

Endorsement Labels

1. The government sets a minimum energy use threshold for entry into a program which recognizes highly energy efficient products

≤ 100 kWh/a

- 2. The manufacturer designs the product to use less energy than the threshold so the product can receive this recognition
- 3. The manufacturer tests the product using a designated test procedure to certify it uses less energy than the threshold
- 4. The manufacturer then submits these results to the government that reviews and approves it
- 5. Once it has been approved, the product's packaging can be labeled with the endorsement label, the manufacture can advertise the product's endorsement, and usually the product will be listed on a government website

Minimum Efficiency Performance Standards (MEPS)

Advantages of MEPS

- Provides predictable effects of eliminating low-efficiency products
- Easy to ratchet levels periodically
- Can be designed to maximize consumer benefits
- Very low per unit transaction costs
- Technology costs borne by consumer who also receives savings benefit

Disadvantages of MEPS

- Usually a mandatory program requires consensus/cooperation among multiple stakeholders
- Can incur some up-front costs for consumers
- Requires good enforcement policy

Savings Potential

Determined by available technology and cost-effectiveness

Major Stakeholders

Manufacturers, environmental groups, consumer groups

Comparative Labels

Advantages of Comparative Labels

- Efficiency less compulsory gives manufacturers the option of a wide range of efficiencies
- Provides strong market incentive for efficiency
- Market evolves over time at accelerated pace
- Low per unit transaction costs
- Technology costs borne by consumer who also receives savings benefit

Disadvantages of Comparative Labels

- Impact of program less predictable
- May be difficult to change labeling scheme
- May or may not maximize consumer benefits

Savings Potential

Determined by market demand for higher efficiency products

Major Stakeholders

Manufacturers, environmental groups, consumer groups

Endorsement Labels

Advantages of Endorsement Labels

- Usually voluntary manufacturers can opt in or out
- Provides market association between efficiency and quality
- Can have large impact if endorsement level becomes de facto standard
- Low per unit transaction costs
- Technology costs borne by consumer who also receives savings benefit

Disadvantages of Comparative Labels

- Impact of program difficult to predict
- May or may not maximize consumer benefits

Savings Potential

Determined by market demand for highest efficiency products

Major Stakeholders

Manufacturers, environmental groups, consumer groups

Test Procedure

Test procedures are the foundation of any standards and labeling program as they are used to determine the energy use of a product.

Test procedures should:

- Reflect typical usage
- Yield repeatable and accurate results
- Be relatively inexpensive to perform

Test procedures can be developed either in country or adopted from an international body.

Testing should be conducted in an accredited laboratory to ensure that tests are being conducted properly.

Chinese Air Conditioner Testing Facility

Manufacturing Cost vs. Energy Savings

Product energy efficiency is the result of a series of incremental modifications to features, technology, and design.

The goal of standards and labeling setting is to strike a balance between increased costs of manufacturing and energy savings.

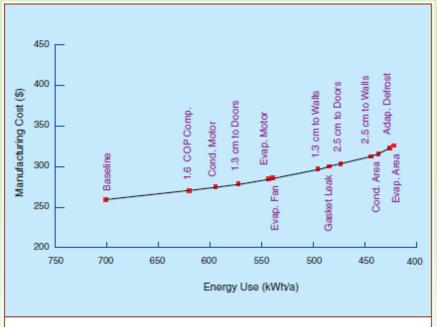

Figure 6-5 Example of fundamental data for engineering analysis: U.S. top-mount auto-defrost refrigerator-freezer

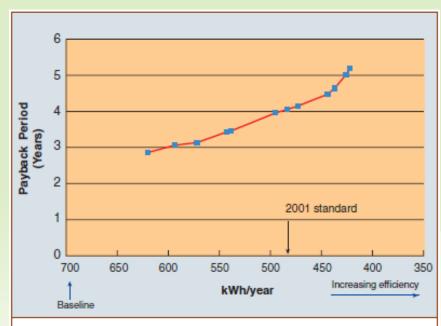

Figure 6-7 Payback periods for top-mount automatic-defrost refrigerator-freezers.

Updating Standards and Labels

Standards and labels must be continually reviewed and revised (3-5 years) to increase stringency and drive continued energy savings.

- As new energy saving technologies are developed and become more cost effective it is important to continually update the stringency of standards.
- Once the market has become oversaturated with high energy efficient products it is necessary to increase the stringency of label requirements in order to keep labels meaningful to consumers.

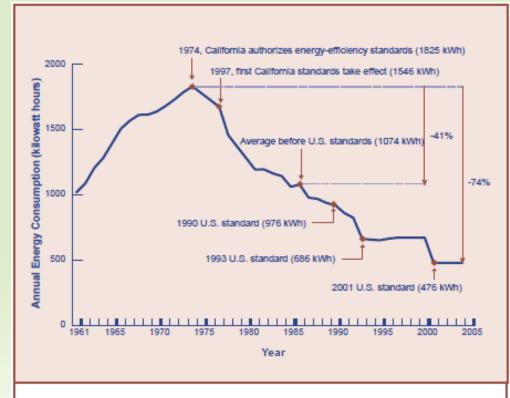

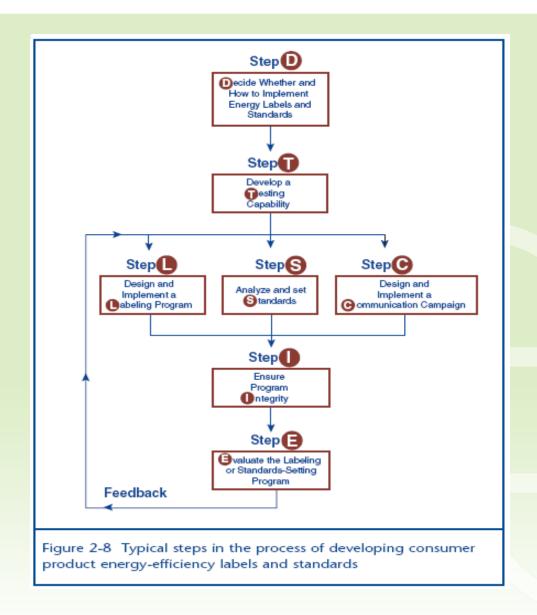

Figure 2-2 The power of ratcheting the stringency of standards: the example of refrigerator standards in the U.S.

Seven Steps in S&L Development

S&L Programs Require Resources

Legal and Authoritative Resources

Clear mandates and lines of responsibility from framework legislation and/or implementing regulation

Financial

A regular and consistent source of operational budgets; annual allocations?
 Fees from testing and/or labeling?

Human Resources

Qualified staff to manage implementation as well as conduct market analysis;
 some outsourcing possible but base management requires dedicated staff

Physical/Facilities

Central offices, field facilities for monitoring/enforcement and/or laboratories for testing?

Institutional

All of the above should culminate in a managing institution with program responsibility

Standards and Labeling: Common Challenging Aspects

Common Challenges in the Test Lab and Testing Arena

- Finding the financial resources for a bricks and mortar (versus policy)
 project
- Getting the order right—need the test lab and procedure before you can regulate
- Defining the Business Model
 - Limited amount of mandatory testing to support business model
 - How to leverage private R&D testing to support the business model
- Test Standards and Test Methods
 - Lack details required to perform tests in the same way across multiple laboratories
 - Do not address innovation and emerging technologies
 - Test Procedure development not synced well in advance of regulations
 - Test Procedures "Slow to Change"
 - Allow "Gaming" during the test process that influence results
 - Correlation between laboratories
 - Uncertainty and Repeatability of test results
 - Difference in Field Data Results vs. Lab Data Results
 - Cost of testing

Need a Model to Prioritize: India Example

ANALYSIS 1: Based on GHG Abatement Potential in India

GHG abatement Potential

=

Surviving stock

Annual energy consumption

energy saving potential of the appliance

Electricity/fuel emission factor

- The model compares GHG Abatement Possible in year 2030 due to application of S&L to the considered products
- The products sold on or after 2014 and surviving till year 2030 have been considered
 - Normal distribution considered for products' useful life
- Calculated based on Hourly Energy Consumption (daily hours of use) days of use per year
- Decided based on maximum theoretical improvement possible, depending upon present performance and specific areas of improvement e.g. in stand by and operating condition
- To facilitate comparison for different fuel types, emission factors have been used to quantify environmental impact on basis of tonnes equivalent of CO₂ abated

Multiple Scenarios Can Be Analyzed

ANALYSIS 2: Based on GHG Abatement Potential and Market Implementability - Both in India

Need

- The product may have high overall GHG abatement potential but the actual implementation of effective labeling program may be difficult due to a host of market and management factors
 - Therefore, we need to include these as well to ensure a more realistic analysis

Basis

- A normalized score for GHG abatement potential is calculated.
- We also calculate the score for 'market implementability' (market implementability index)
- A weighted score for both the parameters gives the ranking for products

Calculation of Market Implementability index

- Market Implementability index is calculated based on following parameters:
 - Test Procedures / Standards
 - Number of stakeholders (manufacturers)
 - % organized sector
 - Implementing association/ partner

The Products are given a score on a scale of 0-4 (0=worst, 4= best) for all these parameters and final scores calculated based on parameter weight and score

Overall Ranking Based on GHG Abatement and Market Implementability - Only Appliances

| Rank | Product | Main Category | GHG Abatement Potential | Market Implementability Score | |
|------|--------------------|--|-------------------------------|-------------------------------------|--|
| | | present analysis criterion weight = | <u>75%</u> | <u>25%</u> | |
| 1 | Air Conditioners | Home Appliances & Equipments | 92.8 | 1.0 | |
| 2 | CTVs | Consumer Electronics & External Power | 51.1 | 1.0 | |
| | | Supply Equipment | | | |
| 3 | Ceiling fans | Home Appliances & Equipments | 26.9 | 0.9 | |
| 4 | Refrigerators | Home Appliances & Equipments | 15.3 | 1.0 | |
| 5 | Washing Machines | Home Appliances & Equipments | 2.3 | 1.0 | |
| 6 | Set top boxes | Consumer Electronics & External Power Supply Equipment | 9.5 | 0.8 | |
| 7 | Uninterruptable | Consumer Electronics & External Power | 13.1 | 0.7 | |
| | Power Supply | Supply Equipment | | | |
| 8 | Geysers | Home Appliances & Equipments | 3.0 | 0.9 | |

Good Label Design Requires Market Research with Stakeholders—Particularly Consumers

- Even though the Ghana program was one of our smallest (~\$110,00 per year)
 CLASP provided T.A. for market research for Ghana label design
- Small sample of consumer focus groups
- Categorical design based on stars was most influential
- Colors and star design reminiscent of Ghana flag to identify labeling as a national program

Compliance & the MV&E Regime

All S&L programs have rules

- Mandatory and voluntary programs
- Contained in legislation or administrative guidelines
- Compliance means adherence to these sets of rules
- Obligations may apply to different stakeholders: suppliers, importers, retailers, wholesalers, on-line suppliers, etc

Rules adopted by different programs vary according to many factors

 Existing legislation, political ambition, national governance issues, resources (in-house and external), stakeholder attitudes, etc.

But all programs have processes and systems to check compliance – the "compliance regime"

This regime (should) comprise several distinct but interrelated elements

Key Elements

DOD

- Designing for, and facilitating, compliance
- Market surveillance (monitoring)
- Verification testing
- Enforcement
- Communication
- Legal and administrative framework
- Budget
- Evaluation

✓ All elements have to be included for the system to work and the required outcomes achieved.

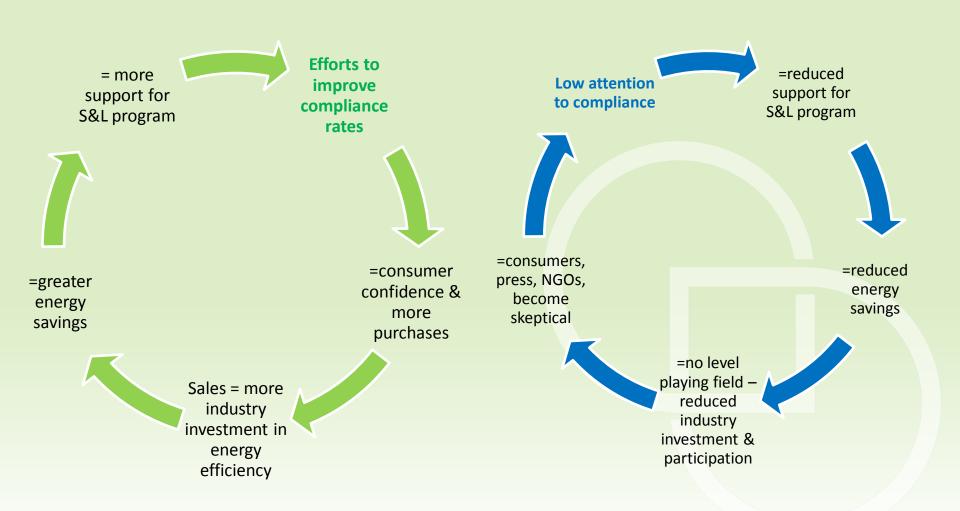

Why Worry About Compliance?

- Safeguard the investment made by governments in building up the credibility of their voluntary and mandatory energy labels;
- Risk that failure to address non-compliance can lead to serious long-term consequences through the erosion of consumer confidence;
- Will require a considerable effort to re-establish credibility;
- Consumers pay for performance that they do not receive;
- Safeguard the investment made by compliant industry participants in order to manufacture and supply energy efficient products;
- Without adequate enforcement, the compliant industry participant is penalised through a loss of economic returns and competitive advantage leading to a disincentive to invest in innovation.

The Circle of Compliance

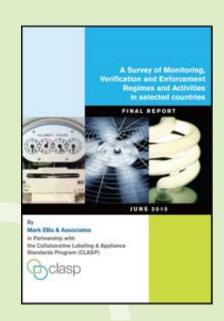

Source: CLASP, Sep 2010, Compliance Counts- A Practitioner's Guidebook on Best Practice Monitoring, Verification, and Enforcement for Appliance Standards & Labeling

ASP How Good are We at Ensuring Compliance?

CLASP Research

- CLASP surveyed S&L programs in G20 countries (+Tunisia & Chile) and found 30 programs spanning 14 countries
- Comparison with surveys of EU Member States

- To assess the strengths and weaknesses of the compliance infrastructure and capacity
- To provide a greater level of evidence to support efforts to tackle compliance
